

Vercel Deployment Guide

The complete step-by-step guide to deploying ATS Resume Builder to production.

Overview

ATS Resume Builder is fully configured for serverless deployment on Vercel. Because Vercel functions are stateless and ephemeral, you cannot use the local SQLite database. You will need a cloud PostgreSQL database. This guide covers the end-to-step process.

Step 1: Set Up a Production Database

Vercel requires a hosted PostgreSQL database. We recommend **Neon.tech** or **Supabase** because they offer excellent free tiers.

1. Go to neon.tech and create a free account.
2. Create a new project and database.
3. Copy the **Connection String**. It will look like this:

```
postgresql://user:password@ep-cool-snowflake-123.region.aws.neon.tech/neondb?sslmode=require
```

Step 2: Push Your Code to GitHub

Vercel deploys directly from your GitHub repository. Your code is already pushed to GitHub!

Your repository is located at: <https://github.com/srinivasgovvala/ResumeAi>

Step 3: Import Project into Vercel

1. Log in to [Vercel.com](https://vercel.com).
2. Click **Add New** → **Project**.
3. Connect your GitHub account if you haven't already.
4. Find the **ResumeAi** repository and click **Import**.

Step 4: Configure Vercel Build Settings

In the 'Configure Project' screen on Vercel, leave the 'Framework Preset' as **Other**. The project already includes a `vercel.json` and `build_files.sh` script, so Vercel will automatically detect how to build it.

Step 5: Add Environment Variables

Before clicking 'Deploy', open the **Environment Variables** dropdown and add the following keys. **This is the most critical step.**

Key	Value Description
<code>DJANGO_SECRET_KEY</code>	A strong, random password string (e.g., 50 random characters).
<code>DEBUG</code>	False
<code>DATABASE_URL</code>	Your PostgreSQL connection string from Neon.tech (Step 1).
<code>ALLOWED_HOSTS</code>	.vercel.app
<code>SITE_URL</code>	Your expected Vercel URL (e.g., https://resumeai.vercel.app)
<code>OPENROUTER_API_KEY</code>	Your OpenRouter API key.
<code>GOOGLE_CLIENT_ID</code>	Your Google OAuth Client ID.
<code>GOOGLE_CLIENT_SECRET</code>	Your Google OAuth Client Secret.
<code>EMAIL_HOST_USER</code>	The email address you use for SMTP.
<code>EMAIL_HOST_PASSWORD</code>	Your SMTP App Password.

Step 6: Deploy!

1. Click the big **Deploy** button.
2. Vercel will install Python, run your migrations (`manage.py migrate`), configure your site, and deploy the application.
3. When it finishes, click **Continue to Dashboard**.

Step 7: Final Google OAuth Fixes

Because your domain changed from `localhost` to a `.vercel.app` domain, you must update Google.

1. Go to Google Cloud Console → Credentials → OAuth 2.0 Client IDs.
2. Add your new Vercel URL to **Authorized JavaScript origins** (e.g., `https://resumeai-yourname.vercel.app`).
3. Add the callback URL to **Authorized redirect URIs** (e.g., `https://resumeai-yourname.vercel.app/accounts/google/login/callback/`).

Congratulations! Your App is Live.

Your ATS Resume Builder is now fully deployed globally on Vercel's Edge Network.
